Video 01 | Welcome and Interface Tour

Massive PSXL instructional series - video script

Runtime estimate	Narration length	Scenes	Format
about 5:31 minutes	782 words at 150 words per minute	12	Screen capture of the plug-in with voice-over; dark theme, interface size 125 percent

Learning goals

- Know what Massive PSXL is and who makes it.
- Recognise every area of the window: top bar, synth panels, lower tabs, macro strip and keyboard.
- Understand the knob gestures that work everywhere.

> **NOTE.** Accuracy rule for the narrator and any generated video: use the on-screen names exactly as written in the action column. After **Load Init (Blank)** the synth is silent until routing is connected. Do not compare Massive PSXL to other products.

Scene table

Scene	On-screen action	Narration (word for word)	Visual notes and call-outs
1	Splash image of the plug-in (MASSIVE PSXL, Phil S Audio) fades to the plug-in window, dark theme, Routing tab showing.	Welcome to Massive PSXL, a wavetable synthesizer from Phil S Audio. In this series we will build sounds from nothing, one idea at a time. This first video is a guided tour, so that when later videos say 'open the Routing tab' or 'drag the macro chip', you know exactly where to look.	Use splash.png full screen for 3 seconds, then cross-fade to a clean, full-window capture. Title lower-third: 'Massive PSXL - Interface Tour'.
2	Mouse sweeps slowly across the whole window from top bar to keyboard drawer area.	The window is organised in layers. Along the top is the bar with presets and global controls. Under it is a row of synth panels: pitch, oscillators, noise, filters, insert, amp and effects. Below that is a large tabbed area, then a strip of sixteen macro knobs, and finally an optional keyboard that slides in from the bottom. Do not worry about memorising every control right now. Think of the window as a map: sound sources at the top, shaping in the middle, movement in the lower area, and performance controls at the bottom.	Overlay five numbered bars labelled Top bar, Synth panels, Lower tabs, Macro strip, Keyboard as the cursor passes each.
3	Zoom to the top bar. Hover Menu, the Edit and Browse tabs, the arrows, the preset name, the volume knob, the meters, Undo, Redo, the Light button and the Keys button in that order.	Starting at the top left: the Menu button holds Load Init Blank, saving, settings and more. Next are the Edit and Browse tabs, then the previous and next arrows around the preset name. On the right you have the master Volume knob, two thin output meters, Undo and Redo, a button to switch between light and dark themes, and the Keys button for the on-screen keyboard.	Pop a small tag next to each control as it is hovered; keep each tag on screen about 1.5 seconds.

Scene	On-screen action	Narration (word for word)	Visual notes and call-outs
4	Zoom to the Pitch panel, then the Oscillator panel. Click the Osc 2 tab, then Osc 1 again. Drag in the wavetable display.	The leftmost panel is Pitch. It has the global Pitch knob, Glide, and the voice mode menu: Poly, Mono or Legato. Next comes the Oscillator panel. Two tabs, Osc 1 and Osc 2, share one display that draws the wavetable as stacked waves. Click or drag in that display and you move the Pos, or position, through the table. Eight knobs sit below it.	Highlight the 3D display with a cyan glow while dragging. Label the eight knobs as they pass: Pos, Pitch, Fine, Level, Unison, Detune, PhaseMod, Fold.
5	Zoom to Noise and Filter panels. Click Filter 2 tab. Open the Model menu and then the Mode menu on Filter 1.	Noise is a third sound source with Level, Color and a type menu. The Filter panel has two filters, selected by tabs. Each has a Model menu with Ladder, State Variable, Comb and Formant, and a Mode menu whose choices change with the model. Cutoff is the big knob, with Reso, Drive and Key Track below it. Notice that the filter tabs are separate. Anything you change while the Filter 1 tab is showing belongs to Filter 1, and the same goes for Filter 2.	Show the Mode menu contents for Ladder: LP 24, LP 12, BP, HP 24. Then flash the Model list.
6	Zoom to Insert, Amp and FX panels. Click through the EQ, Delay, Verb, Chor and Dist tabs.	The Insert is a waveshaper inside each voice with a type menu, Drive and Mix. The Amp panel has Level, Pan and Feedback. On the right, the FX panel has five tabs for the master effects: EQ, Delay, Reverb, Chorus and Distortion. We will use all of these in later videos.	Quick one-second dwell on each FX tab. Lower-third: 'Master effects: EQ, Dist, Chorus, Delay, Reverb' to reinforce the order.
7	Click through the lower tab strip: Voice, Routing, Amp Env, Mod 2, Mod 3 ... Mod 9, Perf 1, Perf 2, Perf 3. Stop on Routing.	Now the big tab strip. Voice holds polyphony, bend range, wavetable library and tuning. Routing is a node editor, the heart of the synth, and it is where the plug-in opens. Amp Env is the loudness envelope. Mod 2 to Mod 9 are eight slots that can each be an envelope or an LFO. And Perf 1 to 3 are three step sequencers called Performers. You will spend most of your time in two or three of these tabs. Routing for connections, Amp Env for the shape of the note, and one of the modulation slots for movement.	Fast cut: each tab shown for 1 second with its content. Color the tab names as in the plug-in: Amp Env and Mods cyan, Performers amber.
8	Zoom to the macro strip. Point at the six chips on the left (Pitch, ModWhl, AftTch, Velocity, KeyTrk, Random), then at the sixteen macro knobs and their M1 to M16 chips.	At the bottom is the macro strip. On the left are six performance sources: pitch bend, mod wheel, aftertouch, velocity, key track and random. To their right are sixteen macro knobs, each with a little crosshair chip. Those chips are the key to modulation: you drag a chip onto any knob to connect it. We cover that in video six.	Animate a dotted line from an M1 chip to a Filter Cutoff knob, then fade it out (preview only; do not actually assign).
9	Click the Keys button. The keyboard slides in. Play a few notes with the mouse; wiggle the Mod wheel; drag the Pitch wheel and release.	Press Keys and a keyboard slides in, with a pitch wheel that springs back, and a mod wheel that stays where you leave it. The keys also light up when MIDI arrives from your controller, which is handy for checking that notes are getting through. Notice there is no sound yet. That is expected, and video two explains why.	Keep the keys visibly lighting. Use a text callout: 'Silent on purpose - no routing yet'.
10	Hover a knob (value appears). Scroll the mouse wheel over it. Right-click it to open the menu, then Escape.	Every knob works the same way. Drag up or down to change it. Use the mouse wheel for small nudges. Hover to see the exact value instead of the label. Right-click for MIDI Learn, Reset to default, and, for modulated knobs, amount and remove options. If you ever want to undo a knob you have turned, the Undo button in the top bar steps back through edits, connections and modulation changes, and Redo steps forward again.	Show the right-click menu with MIDI Learn and Reset to default highlighted.
11	Click Browse, scroll a few presets, click one, play it; click Edit to return. Click the Light button and back to Dark.	Browse opens the preset library of one hundred and seventeen factory sounds. A single click loads a preset. The Light button changes the theme, and the window size can be changed from the Menu, under Settings, Interface size. Remember where these live.	Show both themes side by side for two seconds.

Scene	On-screen action	Narration (word for word)	Visual notes and call-outs
12	Return to the full window; slow zoom out. End card.	That is the whole layout. In the next video we press Load Init Blank, discover why the synth is silent, and make our first sound by wiring the Routing tab ourselves. See you there.	End card: 'Next: 02 Init (Blank) and your first sound'.

Narration only (plain script for text-to-speech or NotebookLM)

[Scene 1] Welcome to Massive PSXL, a wavetable synthesizer from Phil S Audio. In this series we will build sounds from nothing, one idea at a time. This first video is a guided tour, so that when later videos say 'open the Routing tab' or 'drag the macro chip', you know exactly where to look.

[Scene 2] The window is organised in layers. Along the top is the bar with presets and global controls. Under it is a row of synth panels: pitch, oscillators, noise, filters, insert, amp and effects. Below that is a large tabbed area, then a strip of sixteen macro knobs, and finally an optional keyboard that slides in from the bottom. Do not worry about memorising every control right now. Think of the window as a map: sound sources at the top, shaping in the middle, movement in the lower area, and performance controls at the bottom.

[Scene 3] Starting at the top left: the Menu button holds Load Init Blank, saving, settings and more. Next are the Edit and Browse tabs, then the previous and next arrows around the preset name. On the right you have the master Volume knob, two thin output meters, Undo and Redo, a button to switch between light and dark themes, and the Keys button for the on-screen keyboard.

[Scene 4] The leftmost panel is Pitch. It has the global Pitch knob, Glide, and the voice mode menu: Poly, Mono or Legato. Next comes the Oscillator panel. Two tabs, Osc 1 and Osc 2, share one display that draws the wavetable as stacked waves. Click or drag in that display and you move the Pos, or position, through the table. Eight knobs sit below it.

[Scene 5] Noise is a third sound source with Level, Color and a type menu. The Filter panel has two filters, selected by tabs. Each has a Model menu with Ladder, State Variable, Comb and Formant, and a Mode menu whose choices change with the model. Cutoff is the big knob, with Reso, Drive and Key Track below it. Notice that the filter tabs are separate. Anything you change while the Filter 1 tab is showing belongs to Filter 1, and the same goes for Filter 2.

[Scene 6] The Insert is a waveshaper inside each voice with a type menu, Drive and Mix. The Amp panel has Level, Pan and Feedback. On the right, the FX panel has five tabs for the master effects: EQ, Delay, Reverb, Chorus and Distortion. We will use all of these in later videos.

[Scene 7] Now the big tab strip. Voice holds polyphony, bend range, wavetable library and tuning. Routing is a node editor, the heart of the synth, and it is where the plug-in opens. Amp Env is the loudness envelope. Mod 2 to Mod 9 are eight slots that can each be an envelope or an LFO. And Perf 1 to 3 are three step sequencers called Performers. You will spend most of your time in two or three of these tabs. Routing for connections, Amp Env for the shape of the note, and one of the modulation slots for movement.

[Scene 8] At the bottom is the macro strip. On the left are six performance sources: pitch bend, mod wheel, aftertouch, velocity, key track and random. To their right are sixteen macro knobs, each with a little crosshair chip. Those chips are the key to modulation: you drag a chip onto any knob to connect it. We cover that in video six.

[Scene 9] Press Keys and a keyboard slides in, with a pitch wheel that springs back, and a mod wheel that stays where you leave it. The keys also light up when MIDI arrives from your controller, which is handy for checking that notes are getting through. Notice there is no sound yet. That is expected, and video two explains why.

[Scene 10] Every knob works the same way. Drag up or down to change it. Use the mouse wheel for small nudges. Hover to see the exact value instead of the label. Right-click for MIDI Learn, Reset to default, and, for modulated knobs, amount and remove options. If you ever want to undo a knob you have turned, the Undo button in the top bar steps back through edits, connections and modulation changes, and Redo steps forward again.

[Scene 11] Browse opens the preset library of one hundred and seventeen factory sounds. A single click loads a preset. The Light button changes the theme, and the window size can be changed from the Menu, under Settings, Interface size. Remember where these live.

[Scene 12] That is the whole layout. In the next video we press Load Init Blank, discover why the synth is silent, and make our first sound by wiring the Routing tab ourselves. See you there.

> **TIP.** Pause for about one second between scenes and let on-screen actions finish before the next sentence starts.
