Video 11 | Presets, Keyboard, Themes and Wavetable Import

Massive PSXL instructional series - video script

Runtime estimate	Narration length	Scenes	Format
about 4:52 minutes	686 words at 150 words per minute	12	Screen capture of the plug-in with voice-over; dark theme, interface size 125 percent

Learning goals

- Browse, search, save and manage presets.
- Use the on-screen keyboard, MIDI Learn and Mutate.
- Change theme and size, set up Scala tuning and import wavetables.

> **NOTE.** Accuracy rule for the narrator and any generated video: use the on-screen names exactly as written in the action column. After **Load Init (Blank)** the synth is silent until routing is connected. Do not compare Massive PSXL to other products.

Scene table

Scene	On-screen action	Narration (word for word)	Visual notes and call-outs
1	Click Browse. Click category names All, Bass, Leads ... Sequence, User.	Click Browse to open the library. Categories on the left: All, Bass, Leads, Pads, Plucks, Keys, Drums, FX, Sequence and User. There are one hundred seventeen factory presets, all written for this synth. The User category shows your own presets, and All shows everything together, factory and user.	Slow scroll through category list.
2	Type 'bell' in the search box; click a result; double-click another.	Type in the search box to filter by name, category or author. A single click loads a preset. Double-click loads it and closes the browser. The arrows in the top bar step through the whole list without opening it. Presets load instantly, and the Undo history is cleared when a preset loads, so Undo will not take you back to the previous sound.	Show the top-bar arrows highlighted.
3	Make a change (Cutoff down). Menu > Save preset... > Save preset... button; enter 'My Pad', choose Pads; Save.	To save, open the Menu and choose Save preset, then press the Save preset button in the browser. Give it a name, pick a category, press Save. The preset goes in your Music folder under Phil S Audio, Massive PSXL, Presets, in a sub-folder for the category. If you save with a name that already exists in that category, the file is replaced, so use new names for variations.	Show the save dialog and the toast.
4	Click User category; show My Pad; Menu > Open user preset folder.	Your presets appear under User. You can open the folder from the Menu, copy files to back up or share them, and a preset stores routing, modulation, macro names, performer bars and any imported wavetables. A user preset stores every parameter, the routing, all modulation assignments with their amounts, the macro names, the three Performer patterns and any imported wavetables, so it is complete and portable.	Show the Finder window.

Scene	On-screen action	Narration (word for word)	Visual notes and call-outs
5	Menu > Mutate sound (subtle), then (wild); Undo.	Mutate is a quick way to explore. Subtle nudges the continuous voice parameters a little, wild nudges them a lot. It leaves pitch and levels alone. Undo takes it back. Because it only touches continuous voice parameters, mutate will never change your routing, wavetable choice, filter models or effects, so it is safe to use on a patch you like.	Show Undo button lighting.
6	Click Keys; change Menu > Settings > Keyboard size; shift octaves with < >; click keys at different heights; drag pitch wheel and mod wheel.	The Keys button slides in the keyboard. Choose from two to eight octaves in Settings. The arrow buttons shift octaves. Click lower on a key for a harder velocity. Pitch bend springs back; mod wheel stays. Keys light up when MIDI comes in. If you use the computer keyboard to play, click the keyboard first so it has focus. And the keys lighting up when MIDI arrives is a handy way to check that your controller is connected.	Show the label under the arrows (C0 etc.).
7	Right-click a knob > MIDI Learn; move a hardware control; right-click > Clear MIDI mapping.	MIDI Learn works on any knob. Right-click, choose MIDI Learn, move your controller. Mod wheel, sustain and channel messages are reserved. Mappings are saved with your project, not inside presets. Learn macros for performance knobs, and use learn on individual parameters like cutoff or volume for hands-on control. The assignment stays with your DAW project, so each project can have its own mapping.	Show amber ring.
8	Click Light, then Dark. Menu > Settings > Interface size 150%; drag the window corner.	Click Light to switch themes. In Settings choose an interface size from seventy-five to two hundred percent, or drag the window corner. Both are remembered. A bigger interface makes small knobs and Performer bars easier to hit, and a smaller one saves screen space. The setting is remembered between sessions.	Side-by-side theme shot.
9	Voice tab: Load Scala (.scl)...; choose a file; show the MICROTUNING label; then 12-TET.	For microtuning, open the Voice tab and press Load Scala. Pick a scale file, and the tuning name appears. 12-TET restores normal tuning. The tuning lives in your project and is not changed by presets. The scale repeats every period, usually an octave, and degree zero sits on middle C. If a file is not a valid scale file, a message says so.	Highlight the MICROTUNING label.
10	Drag an audio file onto the wavetable display; sweep Pos; select it from the menu as 'User: ...'.	To import a wavetable, drag any WAV, AIFF, FLAC or OGG file onto the oscillator display. It becomes a table named after the file. A single cycle becomes one frame; longer audio becomes many frames you can scan with Pos. Single-cycle waveforms of two thousand forty-eight samples sound cleanest. Longer audio is split into frames and resampled, up to two hundred fifty-six frames.	Show the toast 'Imported wavetable ...'.
11	Save the preset containing the imported table.	Save your preset and the table goes with it. There are twenty-two user slots. Tables are stored inside user presets and inside your DAW project, but factory presets only ever use the built-in tables.	Show Voice tab library list.
12	End card with series recap.	That wraps up the series. Start from Init Blank, connect your nodes, shape with envelopes and LFOs, and assign macros by dragging. Thanks for watching, and enjoy making sounds.	End card: series title and Phil S Audio logo.

Narration only (plain script for text-to-speech or NotebookLM)

[Scene 1] Click Browse to open the library. Categories on the left: All, Bass, Leads, Pads, Plucks, Keys, Drums, FX, Sequence and User. There are one hundred seventeen factory presets, all written for this synth. The User category shows your own presets, and All shows everything together, factory and user.

[Scene 2] Type in the search box to filter by name, category or author. A single click loads a preset. Double-click loads it and closes the browser. The arrows in the top bar step through the whole list without opening it. Presets load instantly, and the Undo history is cleared when a preset loads, so Undo will not take you back to the previous sound.

[Scene 3] To save, open the Menu and choose Save preset, then press the Save preset button in the browser. Give it a name, pick a category, press Save. The preset goes in your Music folder under Phil S Audio, Massive PSXL, Presets, in a sub-folder for the category. If you save with a name that already exists in that category, the file is replaced, so use new names for variations.

[Scene 4] Your presets appear under User. You can open the folder from the Menu, copy files to back up or share them, and a preset stores routing, modulation, macro names, performer bars and any imported wavetables. A user preset stores every parameter, the routing, all modulation assignments with their amounts, the macro names, the three Performer patterns and any imported wavetables, so it is complete and portable.

[Scene 5] Mutate is a quick way to explore. Subtle nudges the continuous voice parameters a little, wild nudges them a lot. It leaves pitch and levels alone. Undo takes it back. Because it only touches continuous voice parameters, mutate will never change your routing, wavetable choice, filter models or effects, so it is safe to use on a patch you like.

[Scene 6] The Keys button slides in the keyboard. Choose from two to eight octaves in Settings. The arrow buttons shift octaves. Click lower on a key for a harder velocity. Pitch bend springs back; mod wheel stays. Keys light up when MIDI comes in. If you use the computer keyboard to play, click the keyboard first so it has focus. And the keys lighting up when MIDI arrives is a handy way to check that your controller is connected.

[Scene 7] MIDI Learn works on any knob. Right-click, choose MIDI Learn, move your controller. Mod wheel, sustain and channel messages are reserved. Mappings are saved with your project, not inside presets. Learn macros for performance knobs, and use learn on individual parameters like cutoff or volume for hands-on control. The assignment stays with your DAW project, so each project can have its own mapping.

[Scene 8] Click Light to switch themes. In Settings choose an interface size from seventy-five to two hundred percent, or drag the window corner. Both are remembered. A bigger interface makes small knobs and Performer bars easier to hit, and a smaller one saves screen space. The setting is remembered between sessions.

[Scene 9] For microtuning, open the Voice tab and press Load Scala. Pick a scale file, and the tuning name appears. 12-TET restores normal tuning. The tuning lives in your project and is not changed by presets. The scale repeats every period, usually an octave, and degree zero sits on middle C. If a file is not a valid scale file, a message says so.

[Scene 10] To import a wavetable, drag any WAV, AIFF, FLAC or OGG file onto the oscillator display. It becomes a table named after the file. A single cycle becomes one frame; longer audio becomes many frames you can scan with Pos. Single-cycle waveforms of two thousand forty-eight samples sound cleanest.

Longer audio is split into frames and resampled, up to two hundred fifty-six frames.

[Scene 11] Save your preset and the table goes with it. There are twenty-two user slots. Tables are stored inside user presets and inside your DAW project, but factory presets only ever use the built-in tables.

[Scene 12] That wraps up the series. Start from Init Blank, connect your nodes, shape with envelopes and LFOs, and assign macros by dragging. Thanks for watching, and enjoy making sounds.

> **TIP.** Pause for about one second between scenes and let on-screen actions finish before the next sentence starts.
